Key Statistical Concepts for Clinicians

Understanding fundamental statistical concepts is vital for appropriate analysis.

Types of Data

- Categorical Data: nominal (e.g., gender) or ordinal (e.g., disease severity). - Continuous Data: measurements (e.g., blood pressure, weight). - Time-to-Event Data: survival times, time until an event occurs.

Common Statistical Tests

- Descriptive Statistics: mean, median, standard deviation, frequencies. - Comparative Tests: - T-tests or Wilcoxon rank-sum for two groups. - ANOVA or Kruskal-Wallis for multiple groups. - Chi-square test for categorical data. - Regression Analysis: - Linear regression for continuous outcomes. - Logistic regression for binary outcomes. - Survival Analysis: - Kaplan-Meier curves. - Cox proportional hazards model.

Step-by-Step Guide to Analyzing Clinical Data in Stata

This section provides practical procedures for performing common analyses.

Descriptive Statistics

- Summarize continuous variables: `summarize blood_pressure age weight` - Tabulate categorical variables: `tabulate gender`

Comparing Two Groups

Example: Comparing systolic blood pressure between treated and untreated groups. 1. Check distribution: `histogram blood_pressure, normal` 2. Test for normality: `swilk blood_pressure` (If normal,

proceed with t-test; if not, use non-parametric test) 3. Perform t-test: `ttest blood_pressure, by(treatment)` Non-parametric alternative: `ranksum blood_pressure, by(treatment)`

Regression Analysis

Linear regression example: To assess the relationship between blood pressure and age: `regress blood_pressure age` Logistic regression example: To evaluate factors associated with disease presence: `logit disease_gender age smoking_status`

Advanced Techniques for Clinical Research

For more complex analyses, the PPCR guide introduces methods like survival analysis, multivariable modeling, and repeated measures.

Survival Analysis

- Kaplan-Meier Estimator: `sts graph, by(treatment)` - Log-Rank Test: `sts test treatment` - Cox Proportional Hazards Model: `stcox age treatment`

Handling Repeated Measures and Longitudinal Data

- Use mixed-effects models (`mixed`) to account for intra-subject correlation. - Example: `mixed blood_pressure time || patient_ID:`

Dealing with Missing Data

- Investigate missingness: `misstable summarize` - Use multiple imputation techniques: `mi estimate: regress ...`

Ensuring Reproducibility and Good Statistical Practice

Reproducibility is essential in clinical research.

Documenting Your Analysis

- Use do-files to record commands. - Comment your code with `*` or `//`.

Quality Checks

- Validate assumptions (normality, homoscedasticity). - Use residual plots: `rvfplot` after regression. - Check for influential points.

Reporting Results

- Present estimates with confidence intervals. - Adjust for multiple comparisons if applicable. - Use

graphical displays for clarity.

Additional Resources and Support

The PPCR Guide for Stata offers a comprehensive, practical approach tailored specifically for clinicians, providing step-by-step instructions to analyze clinical research data effectively. This guide demystifies complex statistical procedures, making them accessible and applicable for healthcare professionals aiming to improve their research outcomes.

Introduction to the PPCR Guide for Stata

The PPCR (Practical Principles for Clinical Research) guide for Stata is designed to bridge the gap between statistical theory and practical application. It emphasizes usability, clarity, and relevance, ensuring that clinicians can confidently handle common analytical tasks, interpret results accurately, and ultimately contribute high-quality evidence to the medical community.

Stata is a powerful statistical software widely used in clinical research due to its versatility, robust statistical capabilities, and user-friendly interface. However, navigating its features can be daunting without proper guidance. The PPCR guide simplifies this journey, focusing on essential analysis techniques relevant to clinicians.

Getting Started with Stata for Clinical Research

Before diving into data analysis, clinicians should ensure they’re familiar with basic Stata operations:

1. Loading Data: Use the `use` command to load datasets (`use filename.dta`).
2. Data Inspection: Use `browse`, `list`, and `describe` to explore your data.

3. Variable Management: Create or recode variables using `generate`, `replace`, and `recode`.
4. Data Cleaning: Address missing values, outliers, and data inconsistencies early.

Structuring Your Clinical Data for Analysis

Clinical research data often involve multiple variables, including patient demographics, treatment groups, outcomes, and time points. Proper structuring is crucial:

1. Longitudinal Data: Multiple measurements per patient over time.
2. Cross-Sectional Data: Single measurement per subject.
3. Hierarchical Data: Patients nested within clinics or regions.

Ensure your dataset is organized accordingly, with clear variable labels and consistent coding.

Core Analytical Techniques in the PPCR Guide for Stata

1. Descriptive Statistics

Start with a comprehensive overview:

1. Summary Statistics: `summarize` for means, medians, standard deviations.
2. Frequency Tables: `tabulate` for categorical variables.
3. Graphical Summaries: Histograms (`histogram`), bar charts (`graph bar`), boxplots (`graph box`).

Example:

summarize age, detail

tabulate gender

graph box blood_pressure, over(treatment_group)

Descriptive stats set the foundation for identifying patterns, outliers, and potential issues.

1. Comparing Groups: T-Tests and Chi-Square Tests

Clinicians often compare outcomes between groups:

1. T-Test (for continuous variables):

ttest blood_pressure, by(treatment_group)

1. Chi-Square Test (for categorical variables):

tabulate adverse_event treatment_group, chi2

These tests help determine if differences between groups are statistically significant.

1. Regression Analysis

Regression models are central to understanding relationships and adjusting for confounders.

1. Linear Regression: For continuous outcomes.

regress blood_pressure age gender treatment_duration

1. Logistic Regression: For binary outcomes.

logit adverse_event age gender treatment_group

1. Interpreting Results: Focus on coefficients, odds ratios (`or`), confidence intervals, and p-values.

logit adverse_event age gender treatment_group, or

1. Survival Analysis

For time-to-event data, survival analysis is vital:

1. Kaplan-Meier Curves:

sts graph, by(treatment_group)

1. Cox Proportional Hazards Model:

stset time_to_event, failure(event)

stcox age gender treatment_group

Properly handling censoring and ensuring the proportional hazards assumption are key.

Advanced Analytical Techniques

1. Adjusting for Confounders: Multivariable Models

Multivariable regression allows you to account for multiple factors simultaneously, reducing bias.

Example:

regress blood_pressure age gender treatment_duration treatment_group

1. Handling Missing Data

Missing data are common in clinical research. Strategies include:

1. Listwise Deletion: Exclude incomplete cases (`if` statements).
2. Multiple Imputation: Use the `mi` suite for more sophisticated handling.

mi set mlong

mi register imputed blood_pressure

mi impute regress blood_pressure = age gender treatment_group, add(5)

1. Subgroup and Sensitivity Analyses

Assess robustness:

regress blood_pressure if subgroup == 1

Use sensitivity analyses to evaluate the impact of assumptions or missing data.

Interpreting and Presenting Results

Effective communication of findings is as important as analysis:

1. Tables: Use `esttab` or `outreg2` for exporting regression results.
2. Graphs: Visualize relationships and differences.
3. Reporting: Clearly state methods, results, confidence intervals, and limitations.

Practical Tips for Clinicians Using Stata

1. Leverage the Documentation: Stata's help files (`help command`) are invaluable.
2. Save Scripts: Use do-files for reproducibility.
3. Validate Your Results: Cross-check with descriptive stats.
4. Seek Collaboration: Collaborate with statisticians when possible.
