It can be continuous-time or discrete-time, deterministic or random. Types of Signals - Continuous-time signals: Defined for all real numbers (e.g., analog audio signals) - Discrete-time signals: Defined only at discrete instances (e.g., digital audio samples) Signal Properties - Energy signals: Have finite energy, integral of the squared magnitude is finite - Power signals: Have finite power, average power over time is finite - Periodic signals: Repeat after a fixed interval - Aperiodic signals: Do not repeat periodically Systems: Characteristics and Classifications Definition of a System A system is a process or device that transforms an input signal into an output signal, often described mathematically through functions or differential/difference equations. System Properties - Linearity: Superposition principle applies - Time-invariance: System behavior does not change over time - Causality: Output depends only on current and past inputs - Stability: Bounded inputs produce bounded outputs Time-Domain Analysis Signal Operations Operations such as shifting, scaling, and superposition are fundamental in analyzing signals. System Response - Impulse response: The output when the input is an impulse; characterizes linear time-invariant (LTI) systems completely - Convolution: Mathematical operation describing the output of an LTI system as the convolution of input and impulse response Differential and Difference Equations - Continuous systems are often modeled via differential equations - Discrete systems are modeled via difference equations Fourier Analysis Fourier Series Decomposes periodic signals into sums of sinusoidal components, useful for analyzing signal spectra. Fourier Transform Extends Fourier Series to non-periodic signals, providing a frequency domain representation of signals. Properties - Linearity - Time-shift and frequency-shift - Convolution theorem - Parseval’s theorem (relation between time and frequency domain energies) Laplace and Z-

Transforms Laplace Transform A powerful tool for analyzing continuous-time systems, especially for differential equations. - Region of convergence (ROC): Critical for system stability analysis - Poles and zeros: Determine system behavior Z-Transform Analogous to Laplace transform but for discrete-time systems, crucial for analyzing difference equations and digital filters. - ROC and stability criteria - Pole-zero plots State-Space Analysis State Variables Represent system dynamics through a set of first-order differential or difference equations.
